Structure and Components of Solved MCQs in Economics

Typical Components

A well-designed solved MCQ in economics generally comprises:

- The Question: Clearly states the problem or scenario.
- Answer Options: Usually four or five options, with one correct answer.
- Correct Answer Highlighted: The key to the question.
- Detailed Explanation: Breaks down the reasoning step-by-step.
- References or Theoretical Basis: Cites relevant concepts or models.

Example Structure

Let's consider an example:

Question:

Which of the following best describes the 'Law of Demand'?

A) As the price of a good increases, demand increases.

B) As the price of a good decreases, demand decreases.

C) There is an inverse relationship between price and demand, ceteris paribus.

D) Demand is unaffected by changes in price.

Correct Answer: C

Explanation:

The Law of Demand states that, ceteris paribus, there is an inverse relationship between the price of a good and the quantity demanded. This means that when the price rises, demand tends to fall, and vice versa. Option C accurately captures this principle. The other options misstate the law or suggest a direct relationship, which contradicts basic economic theory.

- Eliminate Implausible Options

Use logical deduction to discard clearly incorrect choices, increasing your chances of selecting the

correct answer.

- Refer to Theoretical Foundations

When in doubt, recall relevant theories, models, or formulas. For instance, understanding the formula for price elasticity helps solve related questions efficiently.

Consistent practice consolidates knowledge, improves speed, and familiarizes you with question patterns.

Curated Examples of Solved MCQs in Economics

Below are several representative solved MCQs, each accompanied by detailed reasoning and insights.

Example 1: Demand and Elasticity

Question:

If the price elasticity of demand for a good is 0.5, what will be the percentage change in quantity demanded if the price decreases by 10%?

A) 5% increase

B) 2% increase

C) 20% increase

D) 50% increase

Correct Answer: B

Solution and Explanation:

Price elasticity of demand (PED) is calculated as:

$$ PED = \frac{\% \text{Change in Quantity Demanded}}{\% \text{Change in Price}} $$

Given:

$$PED = 0.5$$

$$\%\text{Change in Price} = -10\%$$ (decrease, hence negative)

Rearranging to find the percentage change in quantity demanded:

$$\%\text{Change in Quantity Demanded} = PED \times \%\text{Change in Price}$$

$$= 0.5 \times (-10) = -5\%$$

Since demand increases when prices decrease, the magnitude is positive:

Answer: 5% increase

But note that the question asks for the percentage change in quantity demanded when price decreases by 10%. Because the demand is inelastic (PED
Correct choice: B) 2% increase is not correct; the actual calculation yields 5%. But since B says 2%, we need to re-express. Let's check options.

Actually, the calculation shows 5%. Therefore, the correct answer should be A) 5% increase.

Correction: The initial options had a mistake. The correct answer is:

Answer: A) 5% increase

Key insight: The importance of understanding the sign conventions and the actual calculation process.

Example 2: Market Equilibrium

Question:

In a perfectly competitive market, if demand increases while supply remains unchanged, what is likely to happen?

A) Price falls, quantity decreases

B) Price rises, quantity remains unchanged

C) Price rises, quantity increases

D) Price remains unchanged, quantity increases

Correct Answer: C

Explanation:

An increase in demand shifts the demand curve outward/rightward. With supply unchanged, this leads to:

- Higher equilibrium price (due to increased competition among buyers)
- Higher equilibrium quantity (more goods are demanded at the new higher price)

Thus, the market moves to a new equilibrium with both price and quantity higher.

Answer: C) Price rises, quantity increases

Educational takeaway: Recognizing demand-supply shifts helps anticipate outcomes in market equilibrium.

Example 3: Fiscal Policy Impact

Question:

An increase in government expenditure, assuming other factors constant, will most likely result in:

A) Decreased aggregate demand

B) Increased aggregate demand

C) No change in aggregate demand

D) Increased aggregate supply

Correct Answer: B

Explanation:

An increase in government expenditure is a component of aggregate demand (AD). When

government spending increases:

- Aggregate demand shifts rightward
- This tends to increase overall output and prices in the short run

Therefore, the most probable outcome is an increase in aggregate demand.

Answer: B) Increased aggregate demand

Key learning point: Fiscal policy tools directly influence aggregate demand levels.
