Question 1: The Law of Conservation of Mechanical Energy

A ball is dropped from a height of 20 meters. Assuming no air resistance, calculate the velocity of the ball just before it hits the ground.

Solution Approach:

- Use the conservation of energy principle:

\[

\text{Potential Energy at top} = \text{Kinetic Energy just before hitting the ground}

\]

\[

$$mgh = \frac{1}{2} mv^2$$

\]

- Simplify:

\[

$$v = \sqrt{2gh}$$

\]

- Calculation:

\[

$$v = \sqrt{2 \times 9.8, \text{ m/s}^2 \times 20, \text{ m}} \approx \sqrt{392} \approx 19.8, \text{ m/s}$$

WB HS Physics Question for 2014: A Comprehensive Breakdown and Analysis

In the realm of high school physics, the WB HS Physics Question for 2014 stands out as a significant example that tests students' understanding of fundamental concepts such as motion, force, work, and energy. Analyzing this question provides valuable insights into the application of physics principles and the approach needed to tackle complex problems efficiently. This guide aims to provide a detailed breakdown of the question, explore the core concepts involved, and offer step-by-step strategies for solving similar problems with confidence.

Understanding the Context of the 2014 WB HS Physics Question

The West Bengal Board (WB) High School (HS) Physics examination often features questions designed to challenge students' grasp of core topics and their problem-solving skills. The 2014 question reflects this tradition, emphasizing both conceptual understanding and analytical reasoning. Such questions typically combine multiple concepts like kinematics, dynamics, work-energy theorem, and simple harmonic motion to evaluate a student's comprehensive knowledge.

Before diving into the specific question, it's essential to recall the overarching themes and formulas that are frequently encountered in high school physics exams, especially those from WB:

- Kinematic equations for uniformly accelerated motion
- Newton's laws of motion
- Work-Energy Theorem
- Power and efficiency
- Simple harmonic motion (SHM) principles
- Conservation of energy and momentum

Understanding these basics builds a strong foundation for analyzing the question in detail.

The Structure of the 2014 WB HS Physics Question

While the exact wording of the question may vary, typical physics questions from this era often include:

- A scenario involving a moving object (e.g., a block on a frictionless surface)
- Data provided about velocities, masses, distances, or time intervals
- A requirement to determine a quantity such as work done, final velocity, acceleration, or energy

For illustrative purposes, consider a hypothetical but representative problem similar to what might have appeared in 2014:

Sample Question (Hypothetical Reconstruction)

A block of mass 2 kg slides down an inclined plane of length 5 m and height 2 m without friction. Calculate:

- The velocity of the block at the bottom of the incline.
- The work done by gravity on the block during the motion.
- If a resistive force of 0.5 N acts on the block, determine the velocity at the bottom.

Step-by-Step Analytical Breakdown

Let's analyze this sample problem in detail, which mirrors the type of question posed in 2014.

Part a) Calculating the Velocity at the Bottom of the Incline

Concepts involved:

- Conservation of mechanical energy
- Potential energy converting into kinetic energy

Step 1: Identify known data

- Mass of block, $m = 2 \text{ kg}$
- Length of incline, $L = 5 \text{ m}$

- Height of incline, $h = 2 \text{ m}$
- Gravitational acceleration, $g = 9.8 \text{ m/s}^2$

Step 2: Determine initial potential energy

Potential energy at the top:

$$PE = m g h = 2 \text{ kg } 9.8 \text{ m/s}^2 2 \text{ m} = 39.2 \text{ Joules}$$

Step 3: Assume no friction

Total mechanical energy is conserved:

Potential energy at top = Kinetic energy at bottom

Kinetic energy at bottom:

$$KE = \frac{1}{2} m v^2$$

Set $PE = KE$:

$$39.2 \text{ J} = \frac{1}{2} 2 \text{ kg } v^2$$

Solve for v :

$$v^2 = (2 \cdot 39.2) / 2 = 39.2$$

$$v = \sqrt{39.2} \approx 6.26 \text{ m/s}$$

Answer:

The velocity of the block at the bottom is approximately 6.26 m/s.

Part b) Work Done by Gravity

Concepts involved:

- Work-energy theorem
- Definition of work done by a force

Step 1: Work done by gravity

Work done by gravity:

$$W = m g h \text{ (since gravity acts vertically downward)}$$

As calculated earlier:

$$W = 39.2 \text{ Joules}$$

Note: Since no friction or other forces oppose motion, this work equals the change in kinetic energy.

Answer:

The work done by gravity on the block is 39.2 Joules.

Part c) Effect of Resistive Force on Final Velocity

Concepts involved:

- Work done against resistive force
- Modified energy conservation

Step 1: Incorporate resistive force

$$\text{Resistive force, } F_r = 0.5 \text{ N}$$

Work done against resistive force:

$$W_r = F_r d = 0.5 \text{ N } 5 \text{ m} = 2.5 \text{ Joules}$$

Step 2: Adjust energy conservation

Initial energy:

$$PE = 39.2 \text{ J}$$

Work done against resistance:

$$W_r = 2.5 \text{ J}$$

Remaining energy at bottom:

$$KE = PE - W_r = 39.2 \text{ J} - 2.5 \text{ J} = 36.7 \text{ J}$$

Step 3: Calculate new velocity

Using KE:

$$\frac{1}{2} m v^2 = 36.7 \text{ J}$$

$$v^2 = (2 \cdot 36.7) / 2 = 36.7$$

$$v = \sqrt{36.7} \approx 6.06 \text{ m/s}$$

Answer:

With resistance considered, the final velocity at the bottom is approximately 6.06 m/s.

Critical Concepts and Common Pitfalls

Understanding the problem deeply involves recognizing key principles and avoiding typical errors:

Conservation of Energy vs. Work-Energy Theorem

- In frictionless systems, energy conservation simplifies calculations.
- When resistive forces are present, the work done against these forces reduces the kinetic energy.
- Be cautious to subtract work done against resistive forces rather than ignoring them.

Correct Application of Formulas

- Use the correct form of energy expressions based on the scenario.
- Confirm units are consistent; convert where necessary.
- Remember that work done by non-conservative forces affects the total mechanical energy.

Handling Data and Assumptions

- Clearly identify knowns and unknowns.

- State assumptions explicitly, such as neglecting air resistance or friction if applicable.
- Recognize that the height and length of the incline are related via the sine of the angle if needed.

Broader Implications and Preparation Strategies

Understanding how to analyze questions like the WB HS Physics Question for 2014 is essential for mastering high school physics. Here are some tips for students:

- Master Fundamental Concepts: Be comfortable with energy conservation, Newton's laws, and work-energy principles.
- Practice Diverse Problems: Exposure to varied question formats improves problem-solving flexibility.
- Develop Step-by-Step Approaches: Break down problems into manageable parts, verifying each step.
- Use Diagrams: Visual aids clarify the scenario and assist in identifying the relevant physics principles.
